

QKB\$

QKB\$ returns the contents of the reference or data slot of a parameter

Syntax

QKB\$(ParName\$, DataType\$)

Arguments

- Parname\$ is a string expression containing the name of a parameter in the knowledge base.
- DataType\$ is a string expression returning the data type, either "DATA" or "REFERENCE", corresponding to the slot of which the contents should be returned.

Remarks

1. Any value of DataType\$ starting with "D" or "d" is considered equivalent to "DATA".
 2. Any value of DataType\$ starting with "R" or "r" is considered equivalent to "REFERENCE".
 3. For any other value of DataType\$, QKB\$() returns "[NullString](#)".
 4. If parameter ParName\$ is not present in the correct knowledge base, QKB\$() returns "[NullString](#)".
