

@XML_LIST

The **string relation or constraint** attribute @XML_LIST is used to select the "simple" XML parse method for the [PARSE#\(\)](#) function.

Syntax

Place @XML_LIST:ObjectName in the data slot of the relation or constraint

Remarks

An attribute is introduced for parsing XML that contains a structure of parameter and objects names known in the knowledge base.

For example, you want to import the following data using a relation with the [PARSE#\(\)](#) function:

```
<Ship>
  <Lpp>100</Lpp>
  <B>10</B>
</Ship>
```

Add @XML_LIST:Ship to the data slot of the relation parsing the XML file (using the [PARSE#\(\)](#) function). At this moment it works for a [TeLiTab](#) list. Can not (yet) be used for table data.
