

@MODELPROPAGATION

The **entity** attribute @MODELPROPAGATION is used in an entity (in QEntityData) to force real time propagation of the entire model and recalculation of the current entity upon providing or changing input in this entity..

Syntax

Place @MODELPROPAGATION in the data slot of the entity

Remarks

This attribute can be used if immediate recalculation in the entity is desired and dependencies exist with other entities that are again related to values in the current entity. Please note that this may take much time and can lead to unacceptable waiting time after any input event.
