ASKFIRST

ASKFIRST requests the value of the left hand term **after** asking/computing the arguments inside the ASKFIRST function.

Syntax

ASKFIRST(ValExp, [InpVar])

Arguments

- ValExp is the part to be asked **first**
- InpVar are optional addtional input parameters

Remarks

Together with the ADDGOALS function, this is a function to manipulate the order in which the reasoning mechanisme will ask for parameter values.

Description

Input

B is the value to be asked first. When you would not use the function and you would ask A as top goal, first A would be asked, and when you do not provide A Quaestor would continue with asking B. Now B will be asked first...

Relations

A=ASKFIRST(B)
