

@MULTICASE

The **object parameter** attribute @MULTICASE is used to define that all results of a function object should be maintained as table (instead of only the last evaluation).

Syntax

Place @MULTICASE in the data slot of the parameter

Remarks

This attribute makes sure that object that is used as pseudo-intrinsic function saves all its runs. Each time it is called upon during calculation, a case is added to its content, but only if its combination of argument values are not yet available in the current set of cases.
