

# @TRANPOSED

The **object parameter** attribute @TRANPOSED is used to define an object or entity to be present its table either with one parameter per column or one case per column.

## Syntax

Place @TRANPOSED:BooleanValue in the data slot of the parameter

## Arguments

- BooleanValue is either TRUE (one column per case) or TRUE (one row par case).

## Remarks

If no @TRANPOSED value is provided in either the object or in the QEntityData of an entity, [Quaestor](#) will decide on the orientation of the table in the object. In that case if there are more parameters than cases, the cases are presented per column, if there are less or equal number of cases than parameters, the cases are presented per row. If the @TRANPOSED boolean is provided, the orientation of the table is always as defined.
