

Quaestor License Manager

General Information

The Quaestor License Manager is a server application required to use Quaestor in combination with concurrent user licences. Concurrent user licences enable organisations to be more flexible using Quaestor applications.

The [QLM](#) is a Windows service on a local area network that can manage how many, who and with what kind of [user rights](#) Quaestor can be used. When using the [QLM](#) to manage licencing, you can simply install Quaestor on any workstation (which by default will work as a Demo/Reader version). By providing the address and port-number of the [QLM](#) service during the activation procedure of Quaestor, you can use Quaestor on any workstation in the organisation, depending on the user and the number of licences available.

The [QLM](#) is provided with a Web interface. This enables easy access to the [QLM](#) through an Internet Explorer browser on any computer on the network connected to the server with the [QLM](#).
