

# Trace Viewer

In Quaestor the trace viewer provides a deeper insight into the modeling and evaluation (calculation) process of Quaestor during the creation of a solution. It is a debug facility which is especially useful for the Knowledge engineer.

*Trace recorder*

With the trace recorder you can "tape" the modeling and evaluation steps during the creation of a solution. You can watch at a specific relation, constraint or parameter by adding this to the Watch list. You do this by selecting the relation, constraint or parameter and select "Add to Watch list" in the right mouse click window or use the keyboard shortcut Ctrl+W.

When you have added relation, constraint or parameter to the watch list, this window will open when the relation, constraint or parameter is used in the process (in this sense it behaves like a child window). You have to stop this behaviour by removing the relation, constraint or parameter from the watch list the same way you have added them.
